We use Sala machines to manufacture billet balls.

Before using this machine, we were experiencing some problems in terms of production capacity, quality, and flexibility.

We used multi-spindle machines, which did not ensure the quality and flexibility expected.

Our first impression was extremely positive, especially in terms of machining quality. Even access to the machine for carrying out tooling and maintenance operations is easy. The few service interventions we needed were fast and efficient and the personnel is extremely competent and always willing to help you.

We have been using the Sala machine for more than 5 years.

Not only we have doubled our production but we also increased the quality of our products and reduced tooling and service times by 30%.

Compared to the multi-spindle machines we used before, we enjoyed increased our efficiency, quality, and ease of use.

We are happy to have chosen this machine. In fact, we ordered a second machine to process balls with diameters up to 2" (80 mm).
