

Luca Ramazzotto
Plant Manager at SIRAL S.p.a.
www.siral.com

We use Sala S.r.l. machinery to manufacture brass balls for ball valves, as well as bodies and male cones for gas taps for kitchens and hobs.

We have been collaborating with Sala S.r.l. for a long time, consolidating our relationship over the years. Their technical skills shown in manufacturing their machinery, after-sales service, and attention to technological innovation are key elements to keep our collaboration with Sala S.r.l. strong.

We have used machinery of other brands in the past, but our successful relationship with Sala S.r.l. has convinced us to stick with them.

The capability of manufacturing workpieces featuring high technical specifications and low cycle times, reliability, and flexibility when it comes to changing an item are Sala's main strengths.

Their technical support service is fast and competent. The online and telephone support service allow for quick interventions to help personnel experiencing difficulties.

Over thirty years of collaboration with Sala has made us improve our productivity, especially with regards to workpieces with high technical specifications. It has also helped us maintain the quality of our products at the expected levels and improve the efficiency of our plants. This means reduced routine and special maintenance costs.

Compared to other products on the market, Sala S.r.l. machines provide the following benefits:

- 1) High productivity;
- 2) High production capacity also for workpieces featuring narrow tolerance ranges;
- 3) High reliability over time.

I recommend Sala S.r.l., because they provide their clients with excellent, cutting-edge solutions, always in line with the highest quality standards, while maintaining an excellent quality/price ratio.
