Our on-going quest for increasing competitiveness has prompted us to seek out new solutions and thus evaluate what Sala actually offered us.

Specifically, in view of the high production volumes requested by the customer, we needed to reduce the cost/piece ratio while improving on quality.

Compared to other market proposals, Sala machines provide two main advantages that have proved useful for our type of production:

- execution speed and reduced downtime
- the machine's structural rigidity

I can soundly state that our partnership with Sala has been very satisfactory, especially with regards to research and development processes. Sala's qualified technicians have repeatedly shown that they are capable of accepting new challenges, ready to listen and evaluate objectives, and making every effort to find innovative solutions, satisfying even our most demanding requests.

Sala's customer service has also proved to continuously meet our expectations.
